A MORE APPROACHABLE LOCAL EDITOR

# CentrED# Local

## Celobra Edition 1

What changed from original CentrED# 0.6.11.31.
Local 0.7.3, published and maintained by Celobra.

Celobra Edition 1 adds visible branding and an About/Credits panel to Local 0.7.3. The underlying improvements provide a guided, recoverable building workflow, clearer controls and two ways to inspect a map from a player's viewpoint.

### One local EXE

The editing engine runs inside the app, with no local server login or listening port.

### Map tabs

Switch between separate working copies of map0, map1, map2 and other discovered maps.

### Player inspection

Walk in an approximate editor preview or open your existing game client for testing.

## What the original already did

The original C# editor by kaczy93 already provided map rendering, painting, Undo/Redo, coordinate navigation, a minimap, bookmarks, filters, blueprints, image export and MUL/UOP loading. It also had dockable windows, shortcut remapping and GUI LocalServer hosting, with a separate server option. Local builds on these capabilities.

### A different local workflow

Local removes the need to configure a local server connection for ordinary editing. It retains the engine's validation, map storage and editing services inside the executable. Optional remote collaboration remains a separate workflow.

ORIGINAL AND LOCAL SIDE BY SIDE

# The main differences

| Area | Original 0.6.11.31 | Local 0.7.3 |
|---|---|---|
| **Local setup** | Server-oriented connection/hosting flow, including GUI LocalServer hosting. | Guided local projects use an in-process editing engine. No local account, server configuration or socket is needed. |
| **Map files** | MUL and UOP loading already existed. | Folder discovery finds supported map choices and matching companions, including available x variants. Valid empty statics-index markers are accepted. |
| **Several maps** | A connected map is the central editing session. | Tabs manage separate working copies. Switching saves the current copy; each map keeps its own project, bookmarks and presets. |
| **Saving and recovery** | Saving and basic Undo/Redo were part of the editor. | Verified working copies, checkpoints, automatic backups and recovery records protect committed files. History is named and bounded. |
| **Large operations** | Existing bulk-edit tools provide the foundation. | Preview, incremental progress, cancellation and local checkpoint rollback; added find/replace and cleanup previews. |
| **Blueprints and terrain** | Blueprint and terrain tools already existed. | Blueprint previews, tags, anchors, transforms and placement filters; verified interchange with optional ID/hue mapping. More predictable brush matching. |
| **Rendering and export** | Map rendering and picture export already existed. | Sparse map storage and bounded image-export tiles, with progress, cancellation and completed-output checks. |
| **Collaboration** | Networked editing is an original design strength. | Retained separately, with TLS by default and explicit legacy TCP. External multiplayer acceptance is still unverified. |

Supported UOP is a valid input format. This does not promise every archive or compression variant: unsupported compression and malformed data receive explicit errors.

GUI AND EVERYDAY USE

## A clearer building workflow

The GUI changes make existing editing features easier to understand and add practical controls around them.

| Control | What changes for the builder |
| --- | --- |
| **Visible action bar** | Save map, Undo, Redo, Checkpoint, Go to, Inspector, Layers, Player view, Workspace and Help sit beside the map. |
| **Navigation and artwork** | Explicit X/Y navigation, Back/Forward and clearer per-map bookmarks. Name or exact graphic-ID search, result counts, clear search and helpful empty states. |
| **Inspector and sampling** | A clearer tile stack, safer handling of stale or missing artwork, and direct graphic/hue picking. Right-click tool selection and sampling use plain labels. |
| **Two-corner area picker** | Choose opposite corners on the map or minimap. Picking fills operation or boundary fields; it never starts an edit. Cancel retains the previous area. |
| **XY view boundaries** | Hide terrain and objects outside a region, separately from height and ID/hue filters. Hidden tiles cannot be selected; picture export captures the chosen bounds. |
| **Saved workspaces** | Save panel visibility and docking as named arrangements. Load, rename, delete, choose Editing/Inspection panels or restore the previous arrangement. |

## From original data to a testable map

01 **Choose UO data** - Discover supported maps and their matching statics/index files.

02 **Create a working copy** - Name the project and open its tab; source map files stay separate.

03 **Build and checkpoint** - Edit the working copy, save it and keep a checkpoint before experiments.

04 **Export and test** - Export a separate map set, then install it into matching disposable test data.

PREVIEW AND REAL-CLIENT TESTING

# Two ways to see your build as a player

Both options are included. They serve different stages of inspection and testing.

### 1. Walk inside the editor

Start at the view centre and move a male or female character with WASD or arrows. The camera follows the character. Escape or Return to editing restores the previous view.

### 2. Open your existing client

Choose a client executable and optional arguments, export a separate test map and launch the client in its own window. It uses its own configured data and server.

## What the editor preview can show

- An animated character over the currently loaded map, using character artwork from your supplied UO data.
- Approximate surfaces and clearance. Ignore collision allows free inspection; Hide objects above player offers an approximate roof view.
- A quick check of scale, sightlines and how a route looks. Preview movement does not paint or alter map tiles.

### The real game still needs the real client and server

Doors, live server objects, scripts, equipment, shard movement rules and gameplay must be checked in the intended client/server. The preview is not an embedded full UO client.

## How real-client testing works

| Editor | Test setup |
|---|---|
| Export terrain + statics/index into a new folder, with checksum and artwork-identity information. | Back up receiving files, then install the export into matching test client/server data. |
| Launch the explicitly selected client in a separate window. | Use its existing configuration and test server. Log in and check the build in game. |

There is no automatic installation, live synchronization or embedded game login. Editor changes do not instantly appear in a client that is already running. Client-launch configuration tests passed; no game client was launched or logged in during validation. Map-file export includes the whole map; XY boundaries apply to picture export.

CELOBRA EDITION AND DISTRIBUTION

# Credits, authenticity and release confidence

**399**

**Original 0.7.3 feature validation**
16 shared + 41 backend + 342 editor tests
Zero failed or skipped

The original 0.7.3 package passed real-UOP rendering and synthetic-map editing checks, plus packaged navigation, preview, bounds and layout checks. Monitored original client files stayed unchanged. The number above records that feature validation; Celobra reissue checks are recorded separately with each package.

## Visible credit, verifiable official downloads

Celobra identifies this edition's publisher and maintainer. Branding helps people recognize the official edition; it cannot stop copying or removal of the name. These binaries are unsigned. No certificate signature or registered-trademark protection is claimed.

**Historical reissues.** Local 0.7.0 through 0.7.3 receive separate Celobra Edition 1 packages, with new names and checksums. Original downloads are retained. The feature-version number remains the same; the edition label identifies the branding reissue. Previously downloaded copies cannot be changed remotely.

**Credits and license.** Published and maintained by Celobra, based on CentrED# by kaczy93 (original 0.6.11.31, commit 50d23f7a8d7f). Original copyright, MIT license and third-party notices remain. Celobra branding does not remove permissions granted by those licenses or imply sole authorship of the original code. Pascal CentrED inspired usability ideas; no Pascal source or artwork was copied.

**Storage and recovery.** Complete map checkpoints can consume substantial space. Manage their storage and keep backups. Undo restarts when a map session is reopened and never crosses maps. Recovery protects committed saves; unsaved work can still be lost after a crash.

**Check in your setup.** Test startup and graphics on another Windows computer, dense custom-map performance and external multiplayer. Launch and log in with the intended game client and matching test data/server. Supply your own usable UO data; game maps, art, accounts, saves, credentials and private logs are not bundled.
